

Military History Website Planning Discussion

Project Goal

Build a Wikipedia-style military history website with concise articles, fast loading, strong SEO, and no public editing.

Recommended Stack

Django + HTMX + Tailwind CSS + PostgreSQL + Cloudflare CDN.

Why Not React

React adds unnecessary complexity for an article-focused encyclopedia website. Server-rendered Django is simpler and better for SEO.

SEO Strategy

Use topic clusters, internal linking, semantic HTML, structured data, fast loading, optimized images, and pillar pages.

Best URL Structure

`/world-war-2/battle-of-stalingrad/` , `/leaders/georgy-zhukov/` , `/weapons/t-34/`

Important Features

Categories, timelines, infoboxes, maps, references, search, related articles, and dark mode.

Database Models

Article, Campaign, Battle, Commander, Weapon, Nation, Era, Reference, Tag.

Performance

Use caching, Cloudflare CDN, WebP images, lazy loading, and compressed assets.

Long-Term Growth

Start with 100 high-quality articles, then expand using programmatic SEO and topic hubs.
